Experience

Amazon

Software Engineer · Compliance Fee Platform (EU)

2024 – Present

Hyderabad, India

Automated Seller-Reserves Data Pipeline

- Independently designed and delivered (on schedule) the data pipeline behind a new seller-reserves mechanism that helped close a ~15% recovery gap in compliance fees Amazon pays on sellers' behalf.
- Built it as a scheduled monthly workflow: pulls raw sales data from object storage(S3), runs ETL enrichment, and lands it in a NoSQL store (DynamoDB) for the downstream fee-calculation service.
- Orchestrated the ETL jobs via Step Functions and added resilient queuing with dead-letter queues, automated redrive, and monitoring/alarms — failed ingestions self-recover with no manual effort.

Versioned Sales-Data Warehouse Table (Single Source of Truth)

- Designed and built a new data-warehouse table from scratch, making historical sales data self-service for BI and Product — removing ~20–30 ad-hoc data-pull tickets a year (~20–90 engineering days saved).
- Owned all key design decisions — primary-key and partition-key architecture and the monthly load logic — unifying the differing schemas of every country-category we support into one table.
- Introduced record versioning (not possible when raw storage was the only source), making it the single source of truth for recovery processes (reserves, chargeback), accounting accruals, and a key BI dashboard.

UK Packaging — New Country-Category Launch

- Led the end-to-end launch of a first-ever category in a first-time country under the EPR program, coordinating changes across 5+ partner systems.
- Implemented the fee-calculation logic on our platform from UK seller sales data for both fee types — the service fee and the regulatory eco-fee remitted to authorities — including rate cards and product mappings.
- Delivered seller-facing chargeback reporting and automated monthly accruals with validated revenue records for the accounting close.

Amazon

Software Engineering Intern (6 mo)

2023 – 2024

Bangalore, India

- Migrated authentication for 10+ internal services to a new auth framework as part of Cloud Auth Migration Compliance
- Migrated marketplace level configurations to Amazon Config Store as part of ACS Migration Compliance.

Side Projects & Automation

- On-call Recovery Toolkit (Agentic AI)** — Built AI-powered internal tools with agentic capabilities — LLM tool-calling to an Amazon Bedrock model — that automate the monthly on-call recovery workflow (cohort creation, bulk uploads, day-wise dial-ups), cutting it from ~20 hours/month to ~1–2 hours/month.

Core Skills

Engineering: System Design (HLD/LLD), data pipelines & workflow orchestration, fault-tolerant event-driven systems, on-call operations.

AI Systems & Applications: Building agentic and AI-powered applications — LLM tool-calling (Amazon Bedrock), RAG, prompt design, self-evolving agents, and cost-aware AI application design
